

ABSTRACT OF THE DISCLOSURE

To provide an image editing technique that enables a user to perform movement and magnification of an image with a single operation, and to perform
5 trimming while grasping image composition in printing, the image editing method includes a step of instructing to move an arbitrary point of an image displayed in an image display area among image data; a step of calculating an image movement amount and a
10 magnification ratio in response to the instruction to move the arbitrary point; and a step displaying a predetermined area of the image data in the image display area on the basis of the image movement amount and the magnification ratio, which are
15 calculated in the calculating step.
